

# Multimodality: design

Underlying concepts  
Design space  
Rules of thumb, heuristics

1

## Underlying concepts

2

## The Pipeline Model

- 2 concepts as point of contact between the user and the system:
  - interaction language
  - physical device
- Interaction language: set of well formed expressions used by the system or the user to exchange information
- Inter. language & phys. device = 2 facettes of an expression
  - interaction language = the structure (Hemjslev's form)
  - physical device = the observable (Hemjslev's substance)

3

3

## Underlying concepts Definition of a modality

- Built-in cognitive capability of the system for interpretation and rendering
- Input modality  
Interpretation function: sequence of transformations from input “raw information”
- Output modality  
Rendering function: sequence of transformations to output “raw information”

4

4

## Definition of a modality

- Modality = (device, interaction language)
  - A set of sensors (input devices) or effectors (output devices)
  - A processing facility based on a language

5

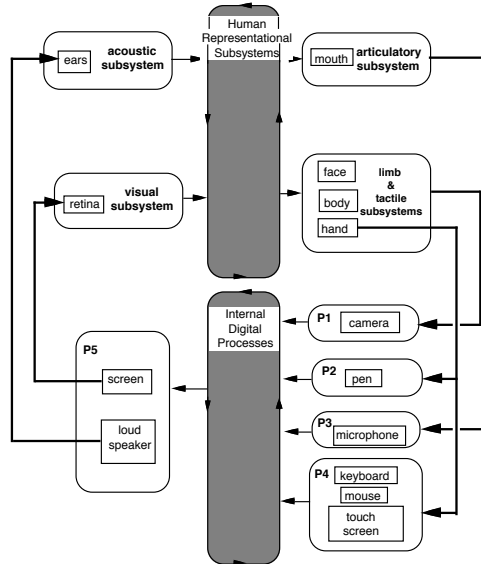

## Definition of a modality

- Modality = (device, interaction language)
  - A set of sensors (input devices) or effectors (output devices)
    - Perception/Action**
  - A processing facility based on a language
    - Cognition**

6

## Definition of a modality

- Theory ICS

7

## Definition of a modality

- Modality = (device, interaction language)
- Multimodality
  - Multi device Mono Language
  - Multi device Multi Language
  - **Mono device Multi Language**
  - e.g. table and graph displayed on screen as two different modalities
    - M1 = (screen, table) and M2 = (screen, graph)

8

8

## Definition of a modality

- Modality = (device, interaction language)
- Interaction paradigms such as perceptual User UI tangible UI, embodied UI and AR open a **vast world of possibilities**

- M1 = (microphone, natural language)
- M2 = (keyboard, command language)
- M3 = (mouse, direct manipulation)
- M4 = (smartphone, 3D gesture) **embodied UI**
- M5 = (HMD, 3D graphics) **AR**
- M6 = (bottle-sensor, 3D gesture) **tangible UI**
- M7 = (GPS, localization) **perceptual UI**
- M8 = (Tongue display, 2D shape)

9

## Definition of a modality

- Input Modality = <d, l>

Speech = <  , natural language >

10

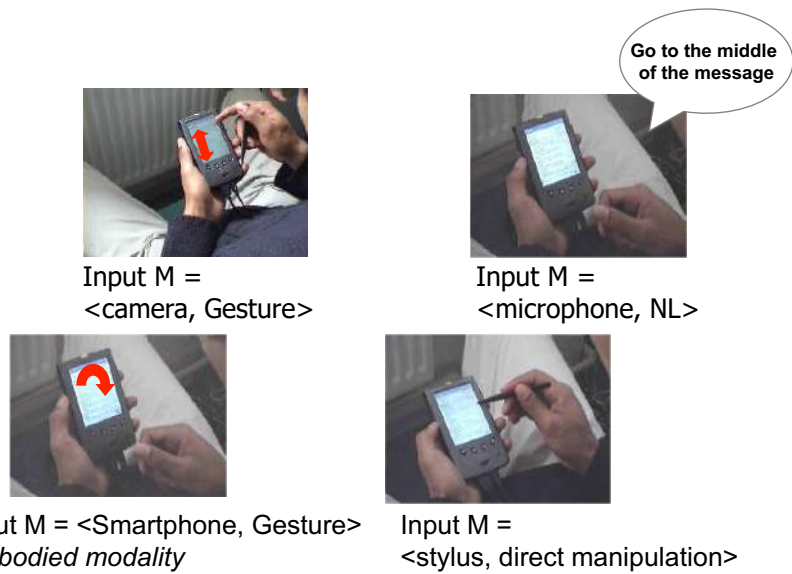

# Definition of a modality

- Input M = <device, text>

11

# Definition of a modality

12

## Definition of a modality

- Input M = <camera-head, gesture>

13

13

## Definition of a modality

- Input M =  
<camera-token, direct manipulation>

14

14

## Definition of a modality

- Input M = <bottle-sensor, gesture>

15

15

## Definition of a modality

- Input Modalities (*sensing modalities*)
- M1 = <GPS, localization>
- M2= <magnetometer, orientation>

16

16

## Definition of a modality

- OUTPUT Modality =  $\langle d, l \rangle$   
M =  $\langle \text{HMD, 3D graphics} \rangle$

17

## Definition of a modality

- Output M =  $\langle \text{loudspeakers, NL} \rangle$
- 3D sound:

**Soundbeam  
Neckset**

18

## Definition of a modality

Output M1 =  
<screen, table>

Output M2 =  
<screen, deformed table>

19

19

## Underlying concepts

- Modality = (device, interaction language)
  - Input modality
    - Interpretation function: sequence of transformations from input “raw information”
  - Output modality
    - Rendering function: sequence of transformations to output “raw information”
- Four intertwined ingredients (for both):
  - 1. Levels of abstraction
  - 2. Context
  - 3. Fusion and fission
  - 4. Granularity of concurrency

20

20

## Underlying concepts

21

21

## Dimension 1: Levels of Abstraction

Expresses the variety of representations supported by the system:

**Interpretation function:** Ability to abstract

**Rendering function:** Ability to materialize

22

22

## Dimension 1: Levels of Abstraction

### Example: Speech input and output

| Interpretation function<br>Ability to abstract to | Rendering function<br>Ability to materialize from |
|---|---|
| Digital signal                                    | Symbolic representation of meaning                |
| Word or a pattern of words                        | Pre-stored text message (text to speech)          |
| Meaningful sentence                               | Pre-recorded vocal message                        |

**We consider two values only:  
MEANING / NO MEANING**

23

23

## Dimension 1: Levels of Abstraction

- The capacity of abstraction may vary with the context
- Example : text editor
  - command mode: text is processed -> high level
  - input mode: text is recorded only -> raw
- Context of commands  
high level interpretation
- Context of task-domain data  
low level interpretation

24

24

## Dimension 2: Use of Modalities

- Supported use of modalities
- Sequential:  
Use of the modalities one after another
- Parallel:  
Use of multiple modalities simultaneously
  - Multiple devices used simultaneously

25

25

## Dimension 3: Fusion

- Independent: (Absence of fusion)  
Independent interpretation/rendering process for each modality
- Combined: (Presence of fusion)  
Fusion of data expressed using different modalities

26

26

## Dimension 3: Fusion

- Combined: Combination of chunks
- It occurs at multiple levels of abstraction
- Lowest level: chunks from distinct modalities
- Higher level: chunks from distinct contexts

27

27

## Dimension 3: Fusion

- **Lowest level: chunks from distinct modalities**
- Fusion of data expressed using different modalities
  - "Put that there" paradigm

28

28

## Dimension 3: Fusion

- Higher levels: chunks from distinct contexts

- Fusion of events
  - Palette
  - Drawing area

29

29

## Dimension 3: Fusion

- Higher levels: chunks from distinct contexts

30

30

## Multimodal versus multimedia

**A multimodal system:**

**Value "Meaning"  
along the axis "Levels of  
Abstraction"**

**=> Four types of multimodal systems**

31

31

## Multimodal system: four types CASE

-  **Exclusive: (Sequential, Independent)**
-  **Alternate: (Sequential, Combined)**
-  **Concurrent: (Parallel, Independent)**
-  **Synergic: (Parallel, Combined)**

32

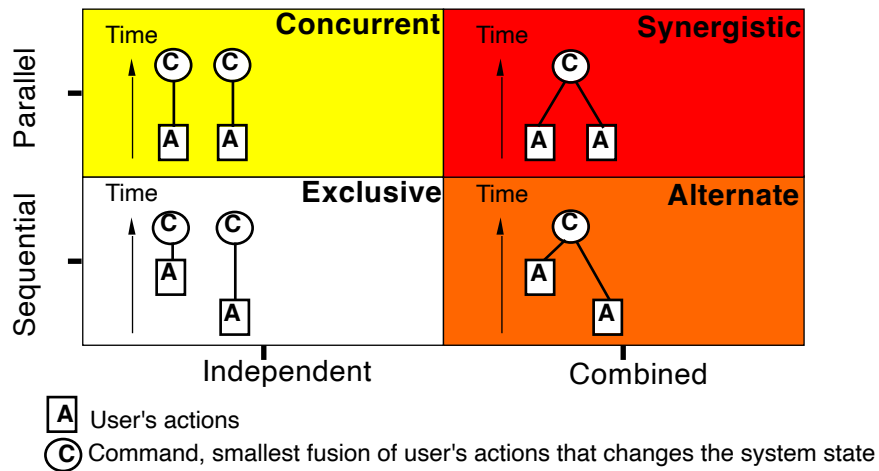

32

# Multimodal system: four types

A multimodal system:

Value "Meaning" along the axis "Levels of Abstraction"

33

33

## Multimodality: design

Underlying concepts

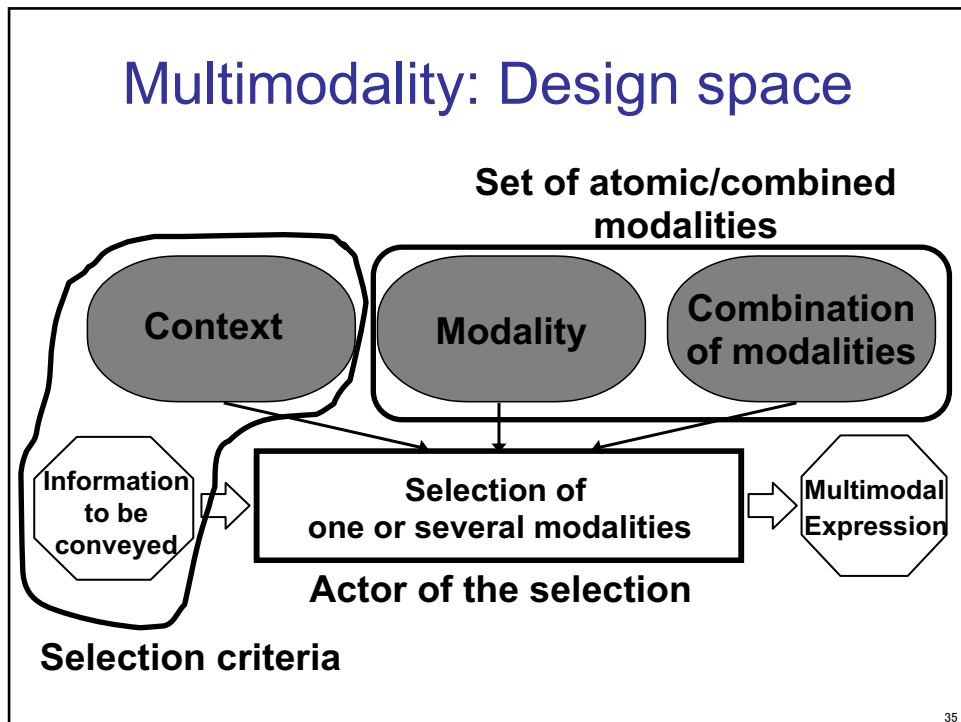

**Design space**

Rules of thumb, heuristics

34

34

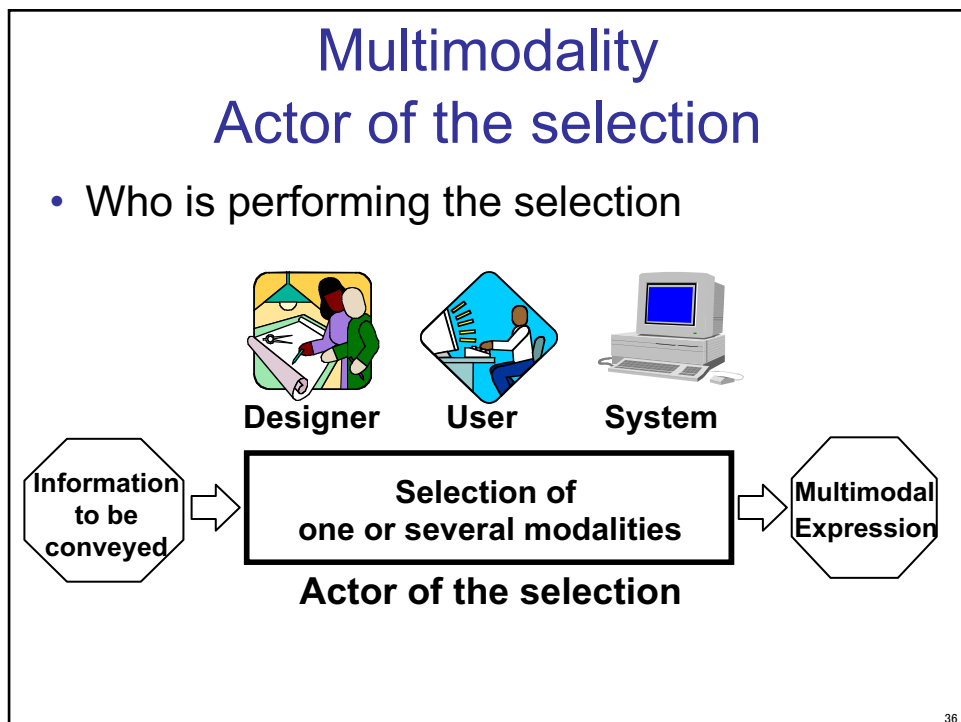

## Multimodality: Design space

35

## Multimodality Actor of the selection

- Who is performing the selection

36

# Multimodality

## Actor of the selection

37

37

# Multimodality

## Adaptability

38

38

## Multimodality Adaptability

- Usage of the modalities
- All sessions / All subjects

39

39

## Multimodality Adaptativity

- Selection of the modalities by the system
- Context-aware systems (passive modality)

**Ring**

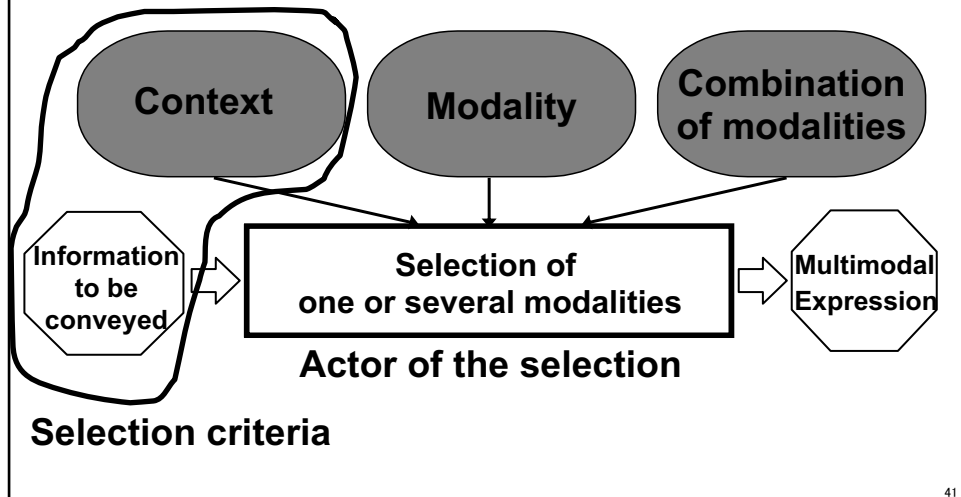

**Vibration**

40

40

## Multimodality: Design space

41

## Multimodality Selection criteria: Context

42

## Multimodality: Design space

43

## Multimodality Characterisation of a modality

- Definition of a modality
- Modality = (device, interaction language)
  - A set of sensors (input devices) or effectors (output devices)
  - A processing facility based on a language

44

# Multimodality

## Characterisation of a modality

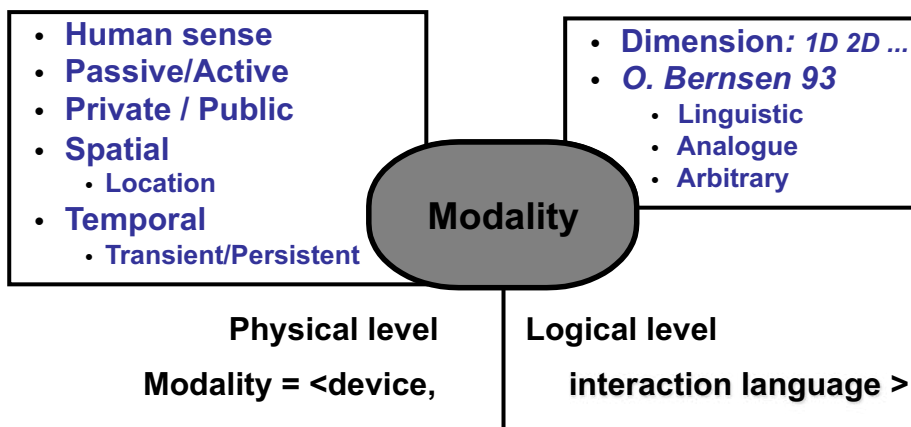

- **ACTIVE MODALITIES**
  - For inputs, active modalities are used by the user to issue a command to the computer such as a pedal to move a laparoscope in a CAS system.
- **PASSIVE - IMPLICIT MODALITIES**
  - Passive modalities are used to capture relevant information for enhancing the realization of the task, information that is not explicitly expressed by the user to the computer (PUI). For example tracking position.

45

45

# Multimodality

## Characterisation of a modality

46

46

## Multimodality

### Characterisation of a modality

47

47

## Multimodality

### Characterisation of a modality

- **Physical level**
  - Human sense: Sight
  - Spatial:  
Location = operating field
  - Temporal: Persistent
- **Logical level**
  - 3D
  - Analogue
  - Non arbitrary

48

48

# Multimodality

## Characterisation of a modality

- **Physical level**
  - Human sense: Sight
  - Spatial: Location = screen
  - Temporal: Persistent
- **Logical level**
  - 2D
  - Non Analogue
  - Arbitrary

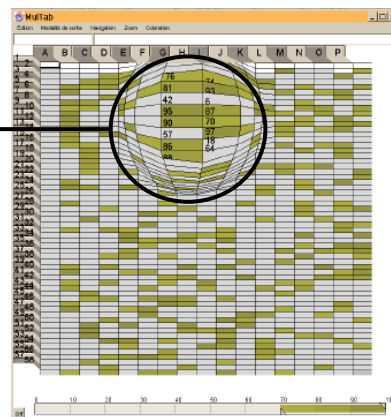

49

# Multimodality

## Characterisation of a modality

- Characterisation of a modality

- **Physical level**
  - Human sense: Sight
  - Spatial: Location = screen
  - Temporal: Persistent
- **Logical level**
  - 3D
  - Analogue
  - Non arbitrary

50

# Multimodality

## Characterisation of a modality

- Phycons as input modalities

- **Physical level**
  - Human manipulation
  - Spatial: Location = desk
  - Temporal: Persistent
- **Logical level**
  - 3D gesture
  - Analogue
  - Non Arbitrary

51

## Multimodality: Design space

Set of atomic/combined modalities

52

# Multimodality

## Combination of modalities

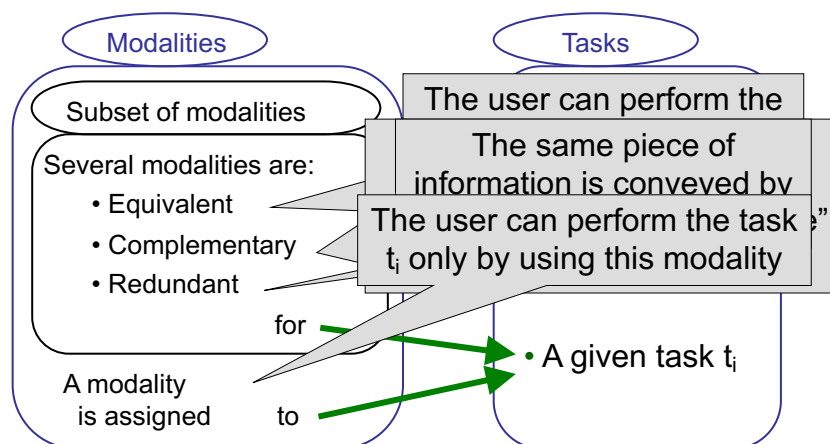

- CARE properties
  - Relationships between Devices, Interaction languages and Tasks
    - C : Complementarity
    - A : Assignment
    - R : Redundancy
    - E : Equivalence

53

53

# Multimodality

## Combination of modalities

54

54

# Multimodality

## Combination of modalities

- The formal expression of the CARE properties relies on the notions of state, goal, modality, and temporal relationships
  - Modality  $m_i = \langle d, l \rangle$  = an interaction method that an agent (user, system) can use to reach a goal.
  - Goal  $g$  = a state  $s'$  that an agent intends to reach from  $s$  using modalities  $m_1, m_n$
  - TR = temporal relationships between the use of modalities  $m_1, \dots, m_n$  (parallelism, sequentiality, cardinality) = // | ; | 1
  - TW = temporal window within which the modalities are used
  - $T = C | A | R | E$  = Complementarity, Assignment, Redundancy, Equivalence

55

55

# Equivalence

- Modalities of set  $M$  are equivalent for reaching  $s'$  from  $s$ , if it is necessary and sufficient to use any one of the modalities

- Equivalence  $(s, M, s')$   
 $\Leftrightarrow$   
 $(\text{Card}(M) > 1) \wedge (\forall m \in M \text{ Reach}(s, m, s'))$

56

56

## Equivalence

- Modalities of set  $M$  are equivalent for reaching  $s'$  from  $s$ , if it is necessary and sufficient to use any one of the modalities

57

## Assignment

- In contrast to equivalence, assignment expresses the absence of choice.
- Modality  $m$  is assigned in state  $s$  to reach  $s'$ , if no other modality can be used to reach  $s'$  from  $s$

- Assignment  $(s, m, s')$

$\Leftrightarrow$

Reach  $(s, m, s')$

$\wedge (\forall m' \in M. \text{Reach}(s, m', s') \Rightarrow m' = m)$

58

58

# Assignment

- Modality  $m$  is assigned in state  $s$  to reach  $s'$ , if no other modality can be used to reach  $s'$  from  $s$

[https://store.google.com/uk/product/google\\_home](https://store.google.com/uk/product/google_home)

59

59

# Assignment

A user interface for configuring user conditions, output, and input for audio-only surfaces. The interface is divided into three main sections: User conditions, Output, and Input. Each section contains a slider control with a range of options.

- User conditions:** Three sliders are shown. The first slider is labeled 'static' on the left and 'in motion' on the right. The second slider is labeled 'private' on the left and 'public' on the right. The third slider is labeled 'poor' on the left and 'rich touch interaction' on the right.
- Output:** Two sliders are shown. The first slider is labeled '+ visual' on the right. The second slider is labeled '+ audio' on the right.
- Input:** Two sliders are shown. The first slider is labeled '+ visual' on the right. The second slider is labeled '+ audio' on the right.

At the bottom left, there is a text label: "/ Audio only surfaces". At the bottom right, there is a small yellow icon of a smartphone.

60

60

# Complementarity

- Modalities of a set M must be used in a complementary way to reach state s' from state s within a temporal window, if all of them must be used to reach s' from s, i.e., none of them taken individually can cover the target state. (fusion required)

61

61

# Complementarity

62

62

# Redundancy

- Modalities of a set M are used redundantly to reach state  $s'$  from state  $s$ , if they have the same expressive power (they are equivalent) and if all of them are used within the same temporal window,  $tw$ .

63

63

# Redundancy

64

64

# Multimodality

## Combination of modalities

- CARE : relationships between modalities and tasks
- => Semantic relationships
  
- Adding the temporal aspect when two modalities are used
  
- **2 aspects: temporal and semantic**
- **5 schemas: [Allen 83]**

65

65

# Multimodality:

## Combination of modalities

## Multimodality: Combination of modalities

- Combination of  
M2 = <screen, color> and  
M3 = <mini-screen, crosses>

### Combination schemas

| <b>Temporal</b> | Anachronism | Sequence        | Concomitance                 | Coincidence        | Parallelism      |
|-----------------|-------------|-----------------|------------------------------|--------------------|------------------|
| <b>Spatial</b>  | Separation  | Adjacency       | Intersection                 | Overlaid           | Collocation      |
| <b>Semantic</b> | Concurrency | Complementarity | Complementarity & Redundancy | Partial Redundancy | Total Redundancy |

# Multimodality

## Combination of modalities

79

# Multimodality

## Combination of modalities

- CARE properties
- TYCOON design space

80

80

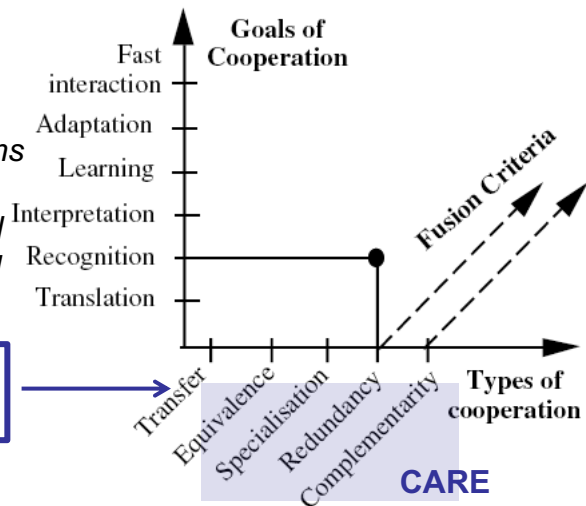

# Multimodality

## Combination of modalities

- TYCOON

When several modalities cooperate by transfer, this means that a chunk of information produced by a modality is used by another modality

**TRANSFER**

81

# Multimodality

## Transfer of modalities

- One modality is used to activate another modality
- Push-To-Talk
- <button, press/release> (*active modality*)
-  <microphone, speech command> (*active modality*)

<https://www.sampsonracing.com/2-Way-Hole-Mount-PTT-with-Mounting-Bracket-p/p0520.htm>

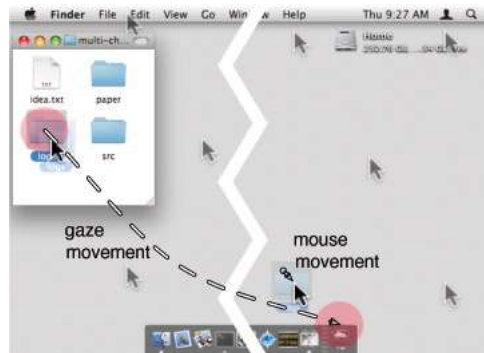

82

82

## Multimodality

### Transfer of modalities

- Eye-tracking is used to select the cursor manipulated by the mouse
- <eye-tracking, 2D position> (*passive modality*)  
➡ <mouse, direct manipulation> (*active modality*)

83

83

## Multimodality

### Transfer of modalities

- Speech is used to modify the behavior of the pointing technique
- <Microphone, name of a color> (*active modality*)  
➡ <3D gesture, pointing-bubble cursor> (*active modality*)

84

84

## Multimodality: design

Underlying concepts

Design space

**Rules of thumb, heuristics**

85

85

## Multimodal input/output

- *Supporting documents: heuristics.pdf*
- A set of multimodal design principles that are founded in perception and cognition science
- Four general areas
  - Designing multimodal input and output
  - Adaptivity
  - Consistency
  - Feedback
  - Error prevention/handling

86

86

## Multimodal input/output

- *Supporting documents: heuristics.pdf*
- **Designing multimodal input and output**
  - Match output to acceptable user input style
    - if the user is constrained by a set grammar, do not design a virtual agent to use unconstrained natural language
- **Adaptivity**
  - Multimodal interfaces should adapt to the needs and abilities of different users, as well as different contexts of use. Dynamic adaptivity enables the interface to degrade gracefully by leveraging complementary and supplementary modalities according to changes in task and context.
    - Allowing gestures to augment or replace speech input in noisy environments, or for users with speech impairments

87

87

## Multimodal input/output

- *Supporting documents: heuristics.pdf*
- **Consistency**
  - System output independent of varying input modalities
    - the same keyword provides identical results whether user searches by typing or speaking
- **Feedback**
  - Users should know which modalities are available to them
- **Error Prevention/Handling**
  - If an error occurs, permit users to switch to a different modality

88

88

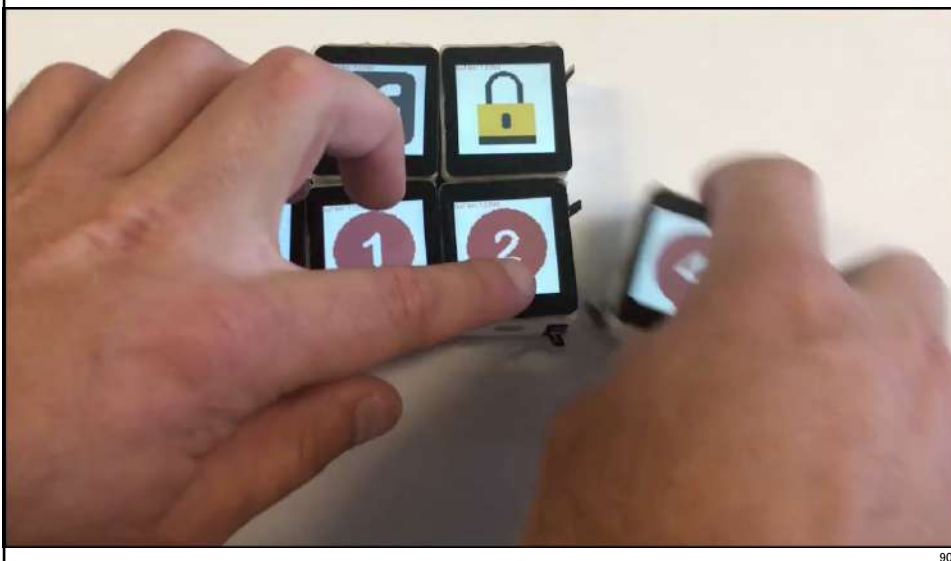

## Design: Main points

- Design space for multimodal interaction
  - Characteristics of a modality
  - Composition space
- Mapping of functionalities onto modalities not always straightforward
  - Few guidelines
  - Experimental study

89

89

## One research avenue: reconfigurable device

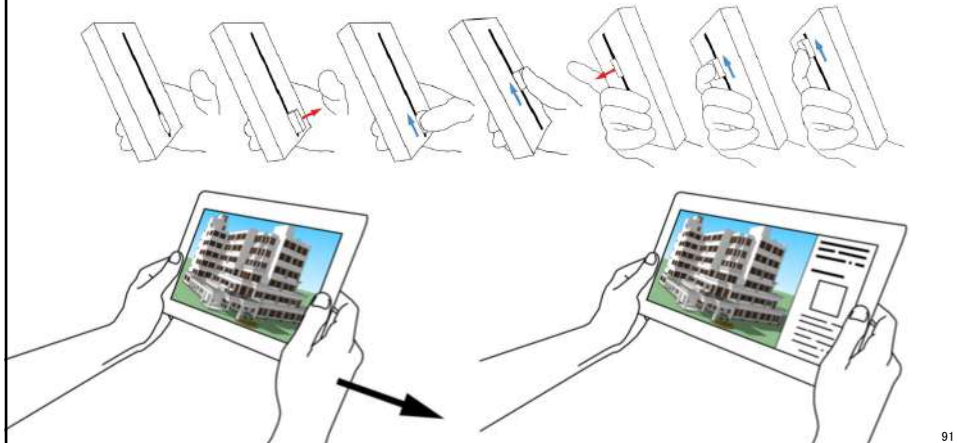

90

90

## One research avenue: shape-changing UI

- Modality <device, language>  
with a deformable device

91

## One research avenue: shape-changing UI
